

Fork Positioner for Forklifts

Forklift Fork Positioner - A fork positioner is a tool constructed out of high quality materials intended to be able to endure the most difficult operations and work environments. This particular piece of equipment could enable drivers to control the forks hydraulically without leaving the seat. Side shifting units have the added ability to laterally position the entire load or the arms in order to facilitate much more exact carrying and placement in a faster and more efficient manner.

The fork pocket is quite unique and enables the person operating it to securely swing the blades into position without any worry of destroying the positioning cylinders. This could allow the driver the choice to execute independent or simultaneous fork movement, depending on the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be transformed into blade positioners on available units.
